NETBIOS Enumeration : if you are trying to enumerate a windows machine :

Syntax : nbtstat -A <target IP>

nbtstat -c (Cached data)

enum4linux :

syntax: root@kali~# enum4linux <ip address of the target>

this is a specific tool in kali linux to enumerate another linux machine.

enumeration using nmap scripting engine:

syntax: open a terminal and locate scripts

root@kali~# locate *.nse (you'll be seeing all the files with file extensions .nse)

if you want to see only a particular search result on the screen you can use

root@kali~# locate *.nse | grep <keyword>

use nmap scripting engine in the following way

root@kali~# nmap -p <port number> --script=<path of the script> <ip address of the target>

DNS Enumeration:

root@kali~# dnsenum <domain name>
